

HEALTH CHECK PRO SERVICE-

Leybold's Health Check PRO service offers a possibility for detecting failures at an early stage. This helps prevent a pump from breakdown resulting in production loss and contributes to lower operating costs.

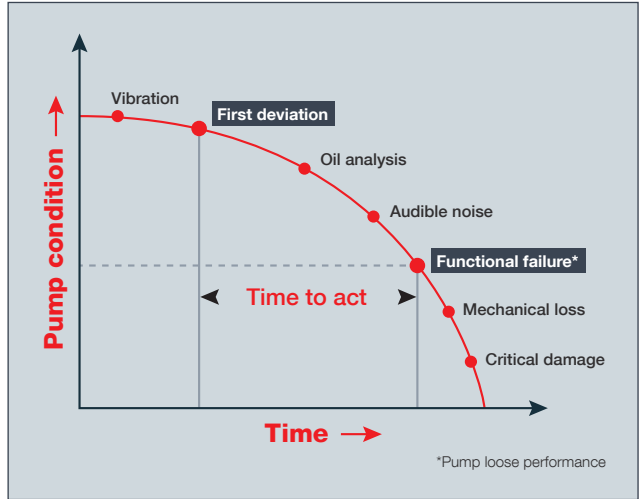

WHY YOU NEED HEALTH CHECK PRO?

Vibration measurement

is a non invasive way to identify deviations in pump condition that otherwise may lead to early life failure. Early detection provides more time to act before problems occur.

Checking for physical signs of **Leaks and Damage** as well as monitoring the condition of **Belts, Filters, Oil** etc. is another way to identify what action might be needed to keep your pumps running efficiently.

Health Check PRO is a new service to help you avoid the expense and inconvenience of unplanned failures. It will help you to understand the condition of your plant and focus on potential issues before they occur, in the most cost effective way. The service report will enable you to compare results between visits and build an accurate picture of how your vacuum pumps are performing.

THE BENEFITS-

Using experienced observation and the latest advances in vibration analytic we can:

- Detect failures before a pump breaks down
- Prevent downtime of stressed pumps operating in harsh environments
- Evaluate maintenance requirements based on a pump's condition
- Monitor and analyse a pump's condition in order to customise service activities. Especially helpful for new pumps or after periods without use

If you are interested in the measurement service, please contact us.
